

## Mamod & MSS Steam Dome

Under the dome sits the steam outlet pipe which is either soldered in place or is made steam tight with an 'o' ring compressed in place by a brass washer and stainless steel spring as seen on the **right**.

These fit together as shown **below**.

It is the compression of the 'o' ring that ensures that the connection for the steam pipe to the boiler is perfectly steam tight.

NB Do not forget that there must be a gasket between the dome nut and the boiler.
